

Usability

○ Usability Testing

Problem

Consider a heavy financial investment in new software but after all nobody wants to use it.

What to do now?

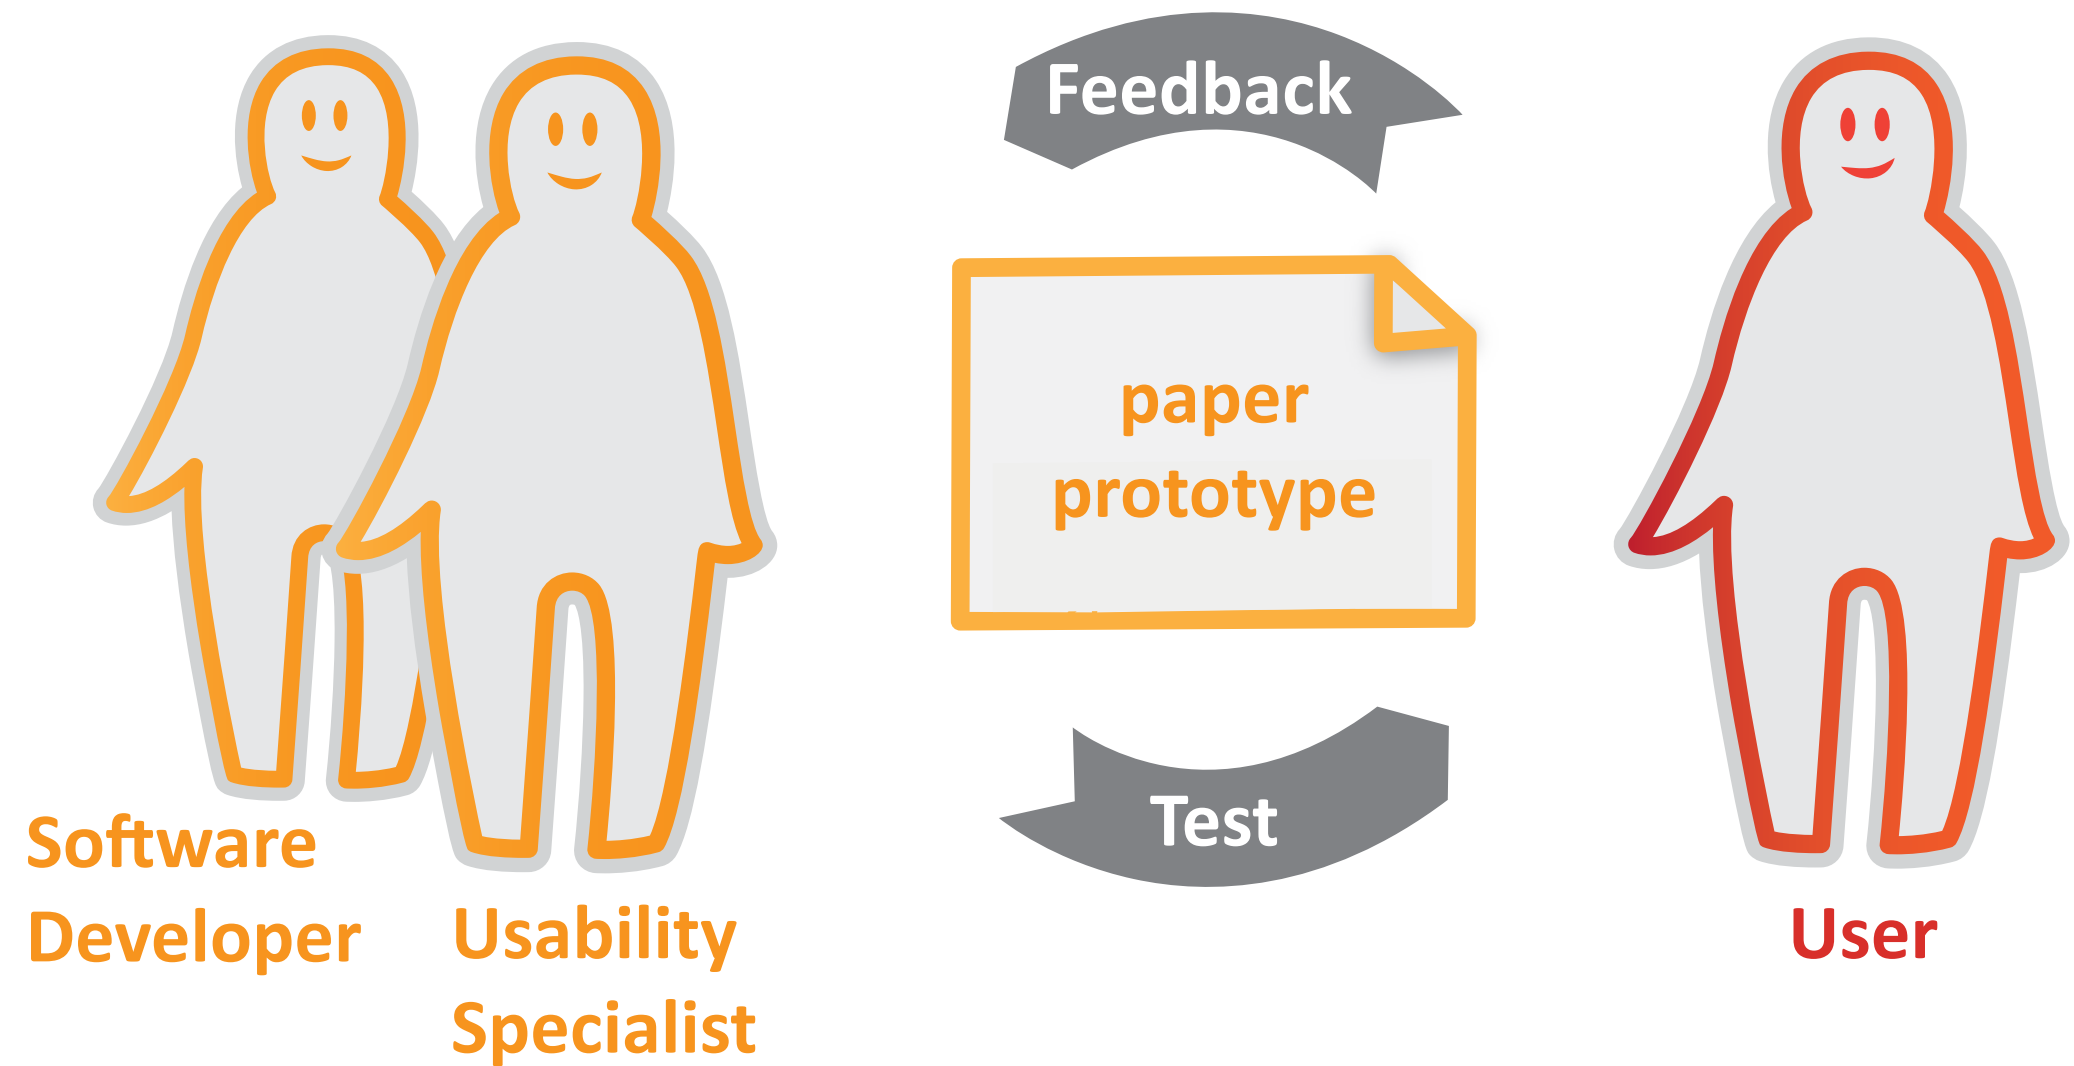

You would need to heavily invest in training, in re-programming and in so-called "chill pills". That costs.

User-centered Design

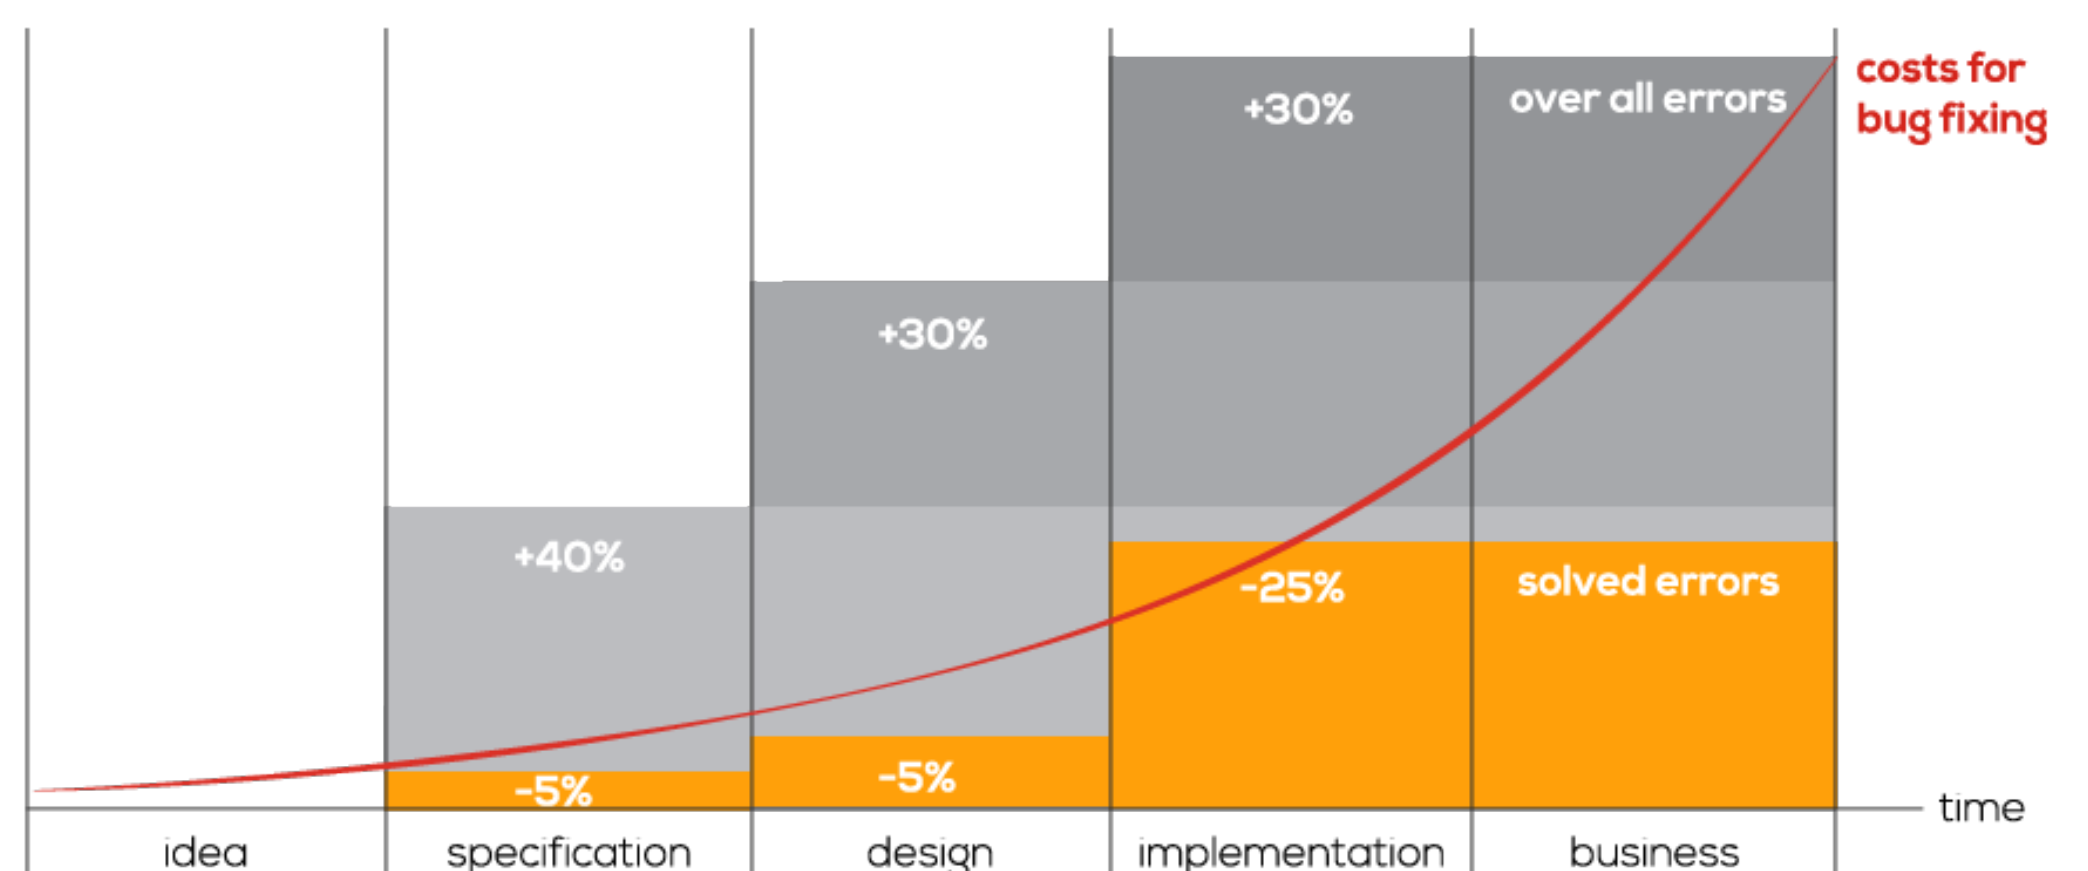

You can prevent heavy costs by integrating usability tests throughout the whole project from the beginning, even before the first line of code is written.

70% of the errors already accrue during specification and design. On average only 5% of these errors are discovered in these early phases. 65% of those errors must be treated immediately before or during the development of the software product. At Catalysts we consider Usability, before we start developing software. We maximize feedback by testing working paper prototypes with real users and save time and thus costs.

Your Benefits

- + You save time in development
- + Problems are pinpointed and corrected at an early stage
- + You avoid costly changes and rework
- + You reduce your effort in documentation, support and user training
